## COP 5537 ASSIGNMENT #1

## 1 Pseudocode for Dijksra's Algorithm

```
Algorithm 1 Dijkstra's Algorithm (Adjacency matrix A, Source s, Destination e)
 1: V \leftarrow \{v_1, v_2, ...., v_n\}

    ▷ Set of vertices

 3: for i \leftarrow 1 to n do
                                                                                                                            ▶ Initialization
                                                                                                         \triangleright Parent of V_i not assigned yet
        parent[i] \leftarrow -1
 4:
        color[i] \leftarrow 0
                                                                                                              \triangleright Vertex V_i not visited yet
 5:
        distance[i] \leftarrow \infty
                                                                                \triangleright Distance of V_i from source node not calculated yet
 6:
 7: distance[s] \leftarrow 0
                                                                                         > Starting to visit the graph from source node
 8:
 9: for i \leftarrow 1 to n do
                                                                                                             ▶ Repeat for all the vertices
        v \leftarrow Min\_dis\_vertex(n)
                                                     > Returns the vertex currently having the minimum distance from the source
10:
        color[v] \leftarrow 1
                                                                                                               ⊳ Mark vertex v as visited
11:
12:
        for all vertices u adjacent to v do
13:
14:
             if distance[u] > distance[v] + A(u,v) and color[u] = 0 then \triangleright A(u,v) is the edge-weight between vertex u and v
                 distance[u] \leftarrow distance[v] + A(u,v)
                                                                                                           15:
                                                                                                                 ⊳ Assign v as u's parent
                 parent[u] \leftarrow v
16:
17:
18: Print_shortest_path(e)
                                                      Dutputs the shortest path between the starting vertex s and ending vertex e
19: return distance[e]
                                                      ▶ Returns the shortest path between the starting vertex s and ending vertex e
Algorithm 2 Min_dis_vertex(n)
 1: min_val \leftarrow \infty
 2: for i \leftarrow 1 to n do
 3:
        if color[i] = 0 and distance[i] < min_val then
 4:
 5: return index
                                       > Returns the index of the non-visited vertex having minimum distance from source node
```

```
    if parent[v] = -1 then
    return
```

3: Print\_shortest\_path(parent[v])

▶ Recursion

4: Output v
